Trivial case: Can we use SLAM to
find the fault responsible for the
M 6.0 South Napa earthquake of
24 August 2014?

South Napa Earthquake
M 6.0, August 24, 2014

Polaris Fault near Truckee, North Tahoe area, California

- Discovered in 2009
- Right-lateral fault
- Surface trace confirmed with trenches and lidar-based geomorphic analysis
- No reported historic earthquakes

6.12.2004, M3.7
depth 7.3 km
 e_h 0.1 km e_v 0.1 km

6.12.2004, M3.4
depth 7.3 km
 e_h 0.2 km, e_v 0.2 km

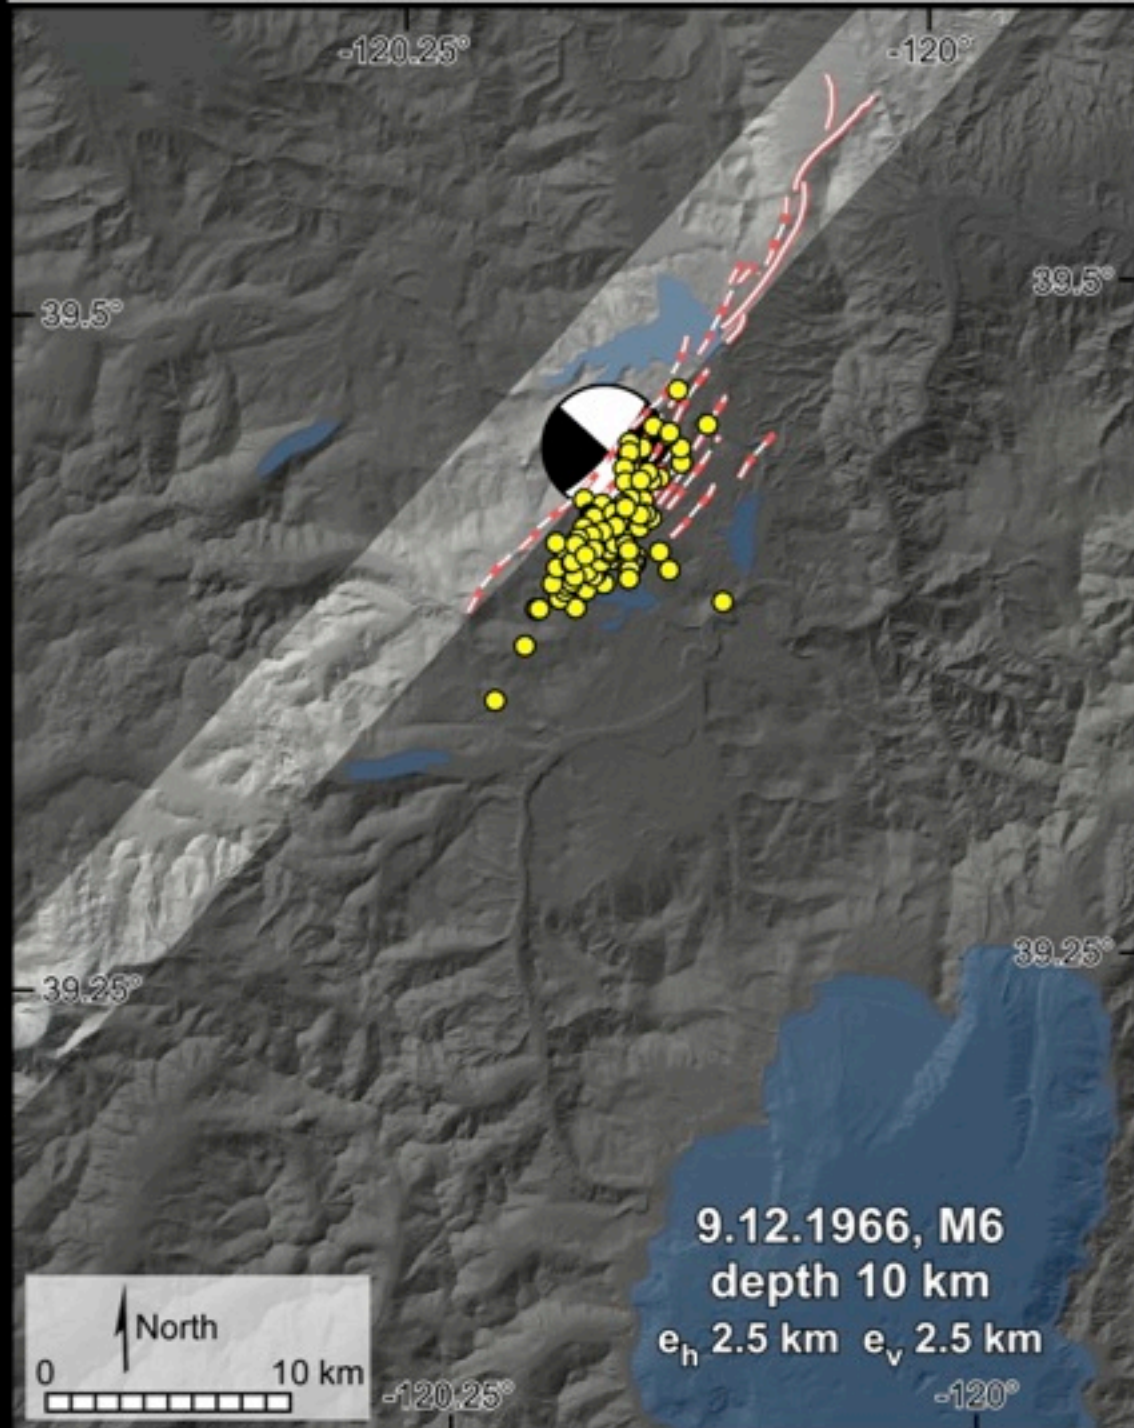

SLAM analysis shows there have been historic earthquakes consistent with displacement along the Polaris Fault.

SLAM analysis shows there have been historic earthquakes consistent with displacement along the Polaris Fault.

The Polaris Fault extends under and adjacent to Martis Creek Dam and Reservoir.

Dog Valley Fault near Truckee, North Tahoe area, California

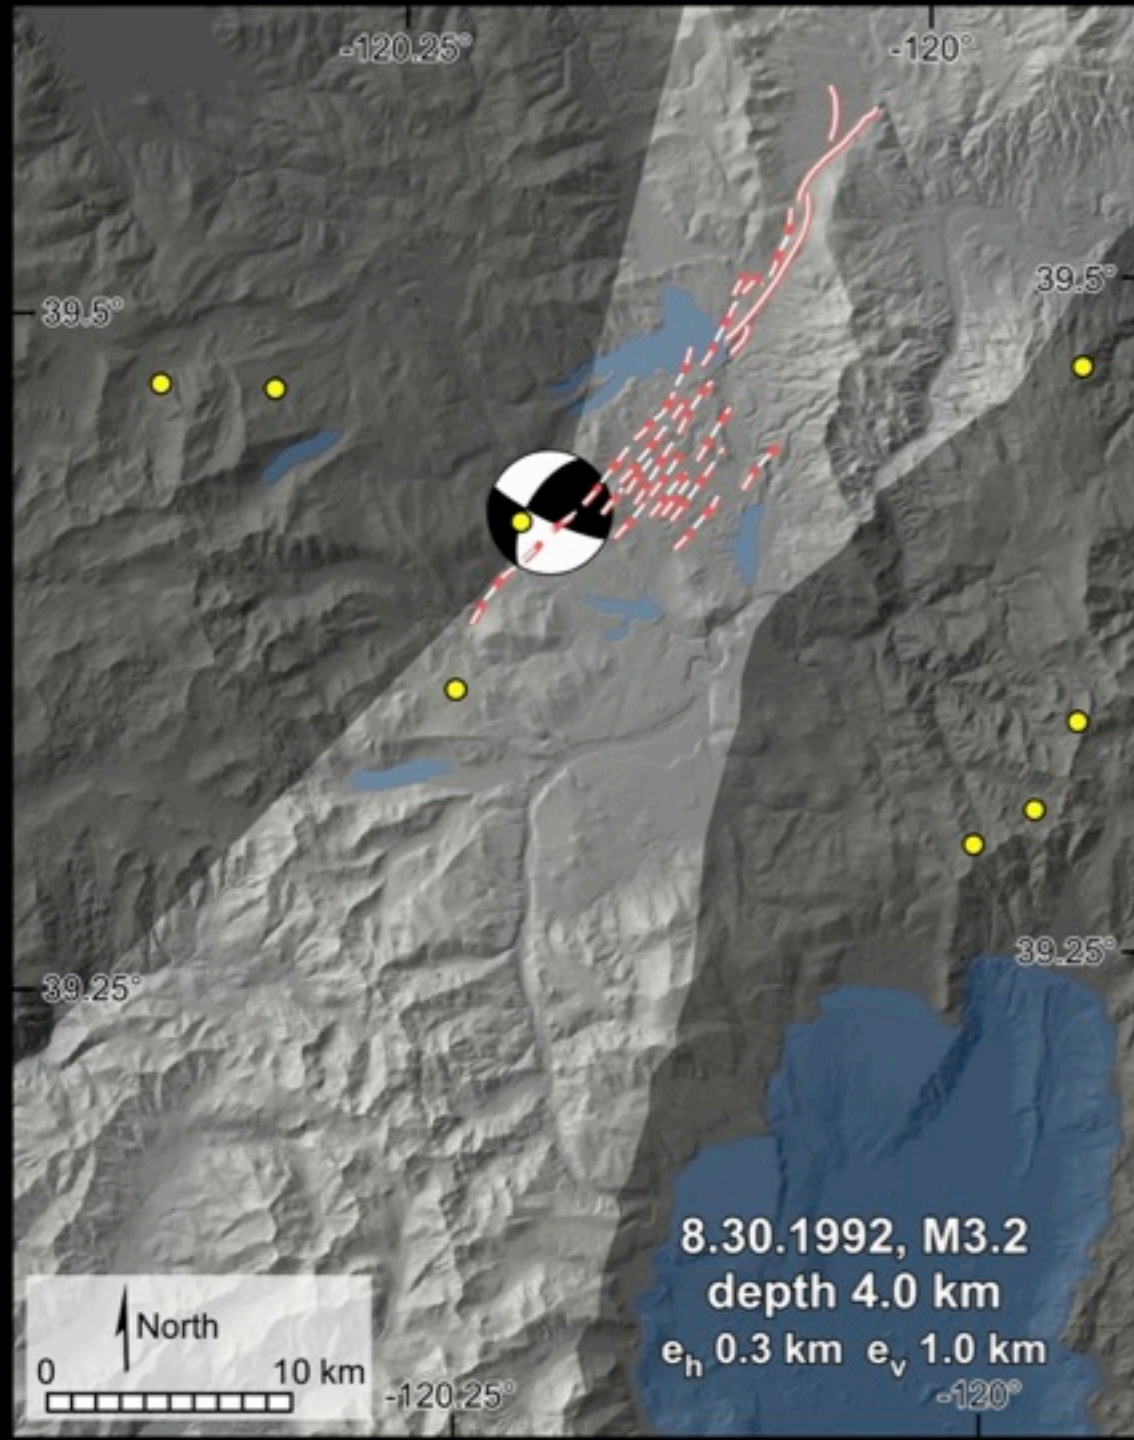

- Generated M_L 6.0 Truckee earthquake of 1966; left-lateral focal mechanism
- Surface trace inferred but not confirmed.

7.3.1983, M4.0
depth 11.1 km
e_h 0.3 km, e_v 0.8 km

12.23.2011, M3.1
depth 0.4 km
 e_h 0.0 km e_v 0.0 km

SLAM analysis shows that, after the M 6.0 Truckee Earthquake sequence in 1966, several M 3-4 earthquakes occurred between 1983 and today that are consistent with displacement along the Dog Valley Fault.

Is the inferred trace of the Dog Valley Fault that is depicted in the Quaternary Fault and Fold Database of the United States accurate?

Results from SLAM suggest that the Dog Valley Fault has a different trace than has been inferred in the past, and that several small-moderate earthquakes have occurred along the DVF since 1966.

Results from SLAM suggest that the Dog Valley Fault has a different trace than has been inferred in the past, and that several small-moderate earthquakes have occurred along the DVF since 1966.

The DVF extends under Stampede Dam and Reservoir.

SLAM applied to earthquakes
that have not been associated
with any known faults

Prosser Creek Trend near
Truckee, North Tahoe area,
California

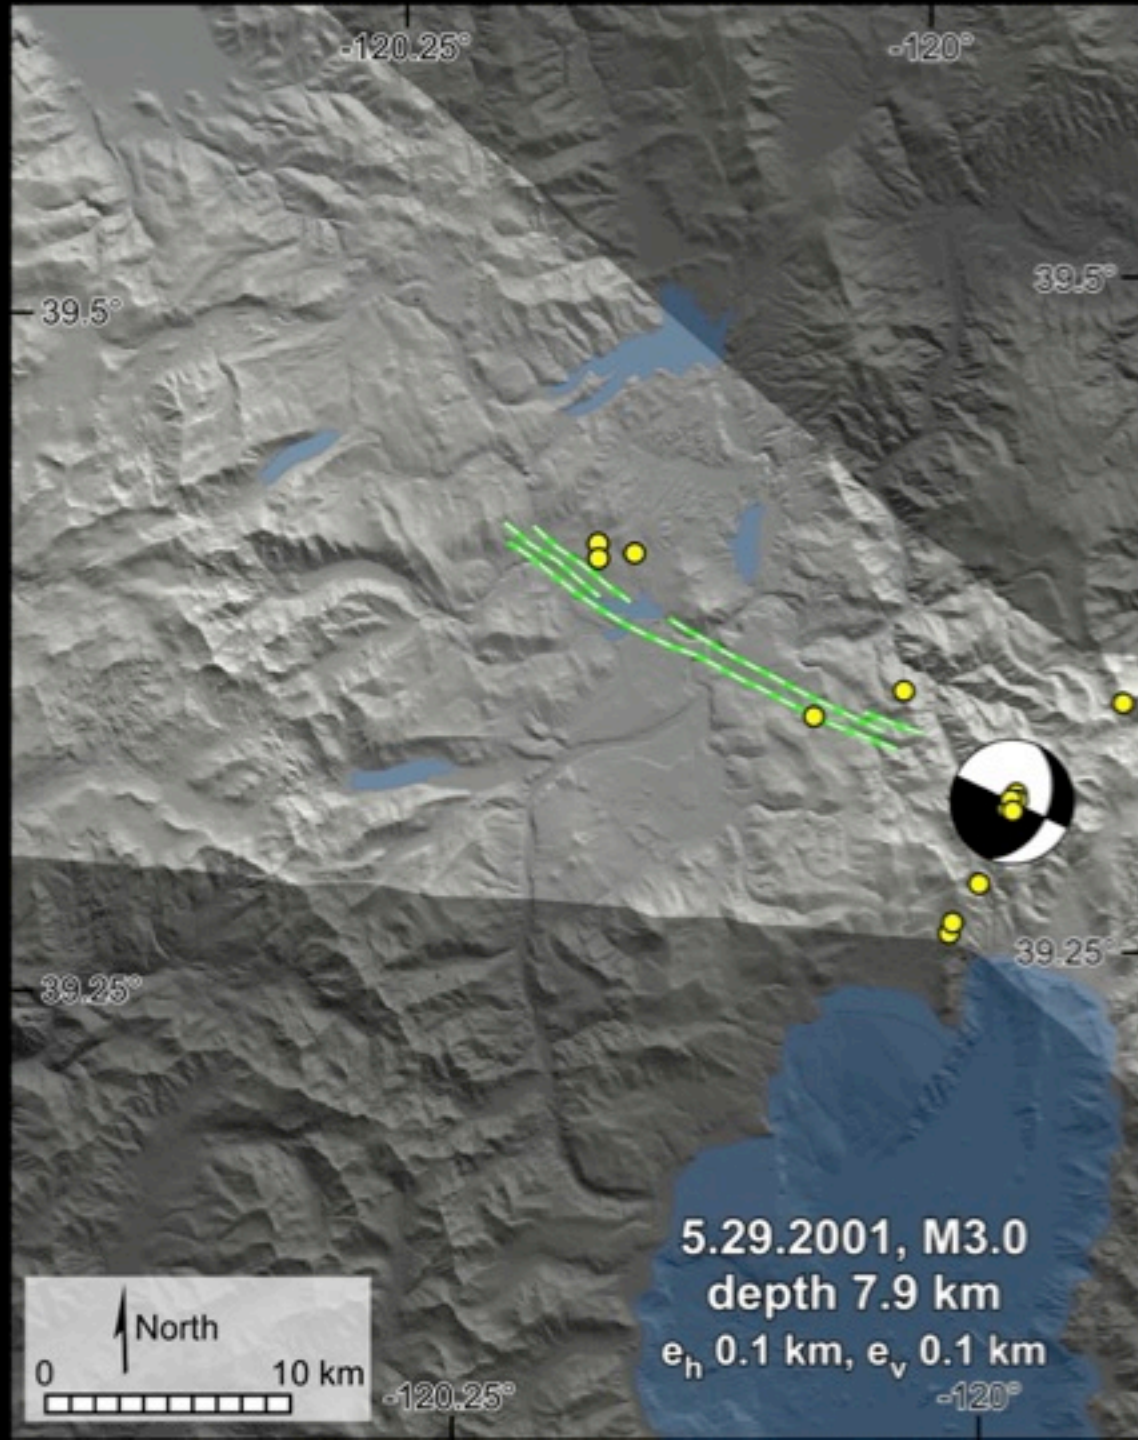

4.8.1995, M3.0
depth 10.2 km
 e_h 3.6 km, e_v 3.6 km

10.30.1998, M4.8
depth 10.7 km
 e_h 2.2 km, e_v 2.2 km

-120.25°

-120°

39.5°

39.5°

39.25°

39.25°

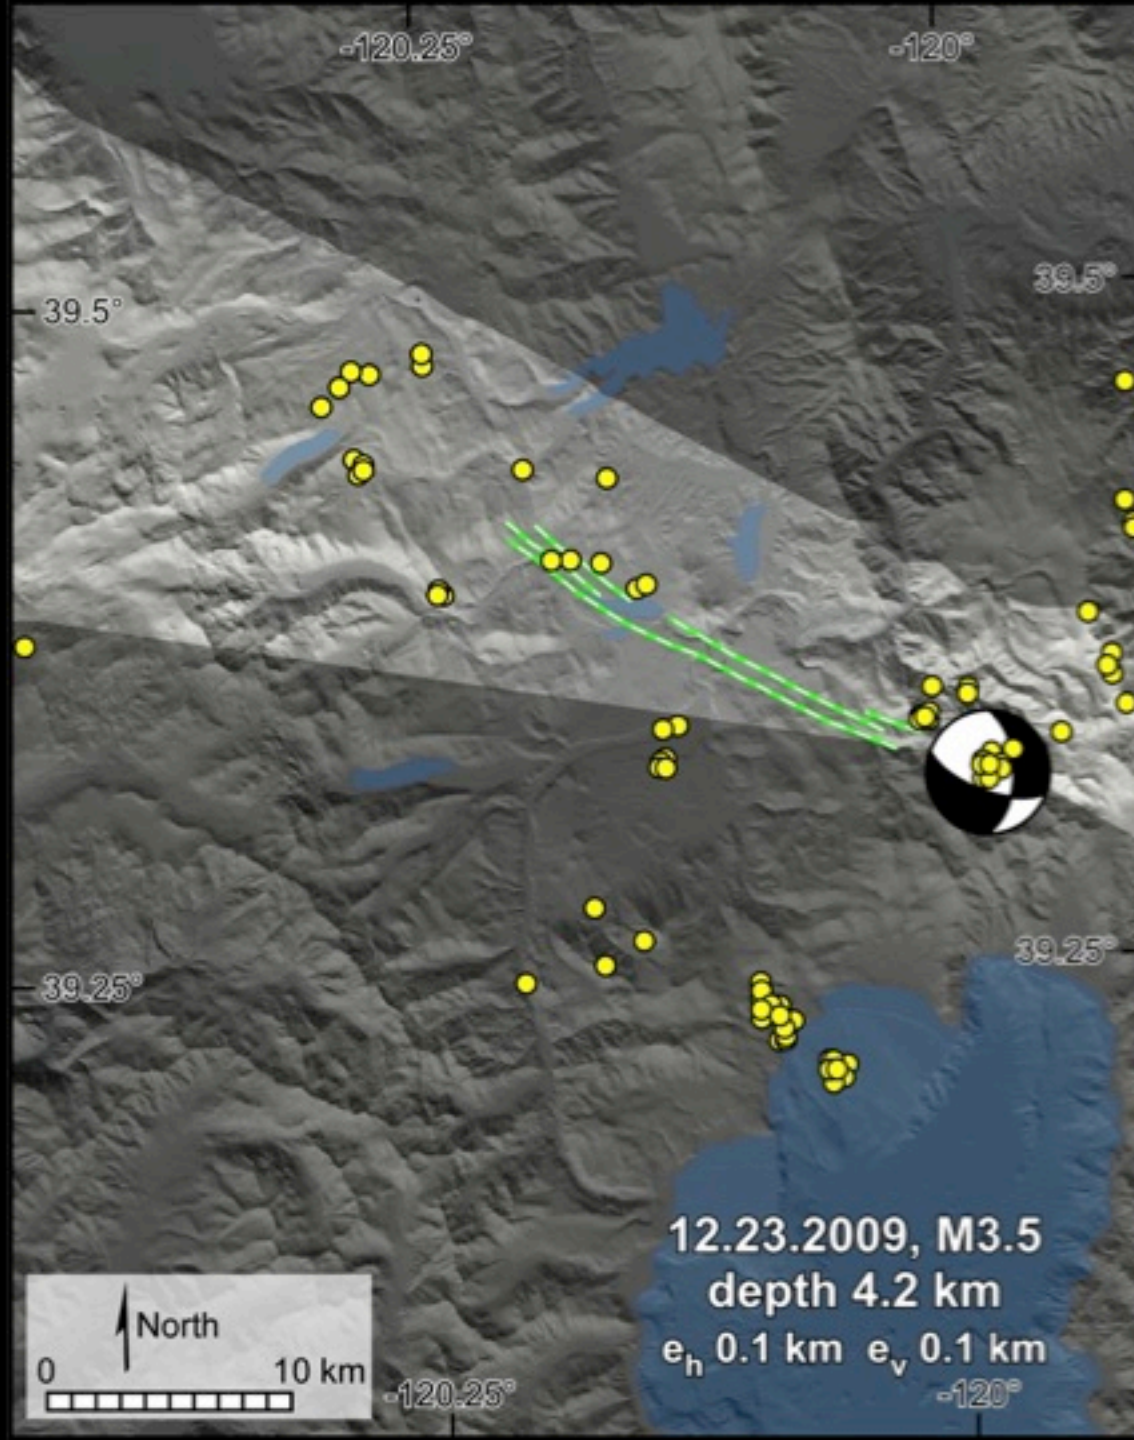

5.29.2001, M3.0
depth **7.9 km**
 e_h **0.1 km**, e_v **0.1 km**

-120.25°

-120°

12.23.2009, M3.5
depth 4.2 km
 e_h 0.1 km e_v 0.1 km

SLAM results suggest that the Prosser Creek Trend might be a right-lateral fault that has generated historic earthquakes.

SLAM results suggest that the Prosser Creek Trend might be a right-lateral fault that has generated historic earthquakes.

The Prosser Creek Trend extends under Prosser Creek Dam and Reservoir.

SLAM applied to earthquakes
that have not been associated
with any known faults

Martis Creek Trend near
Truckee, North Tahoe area,
California

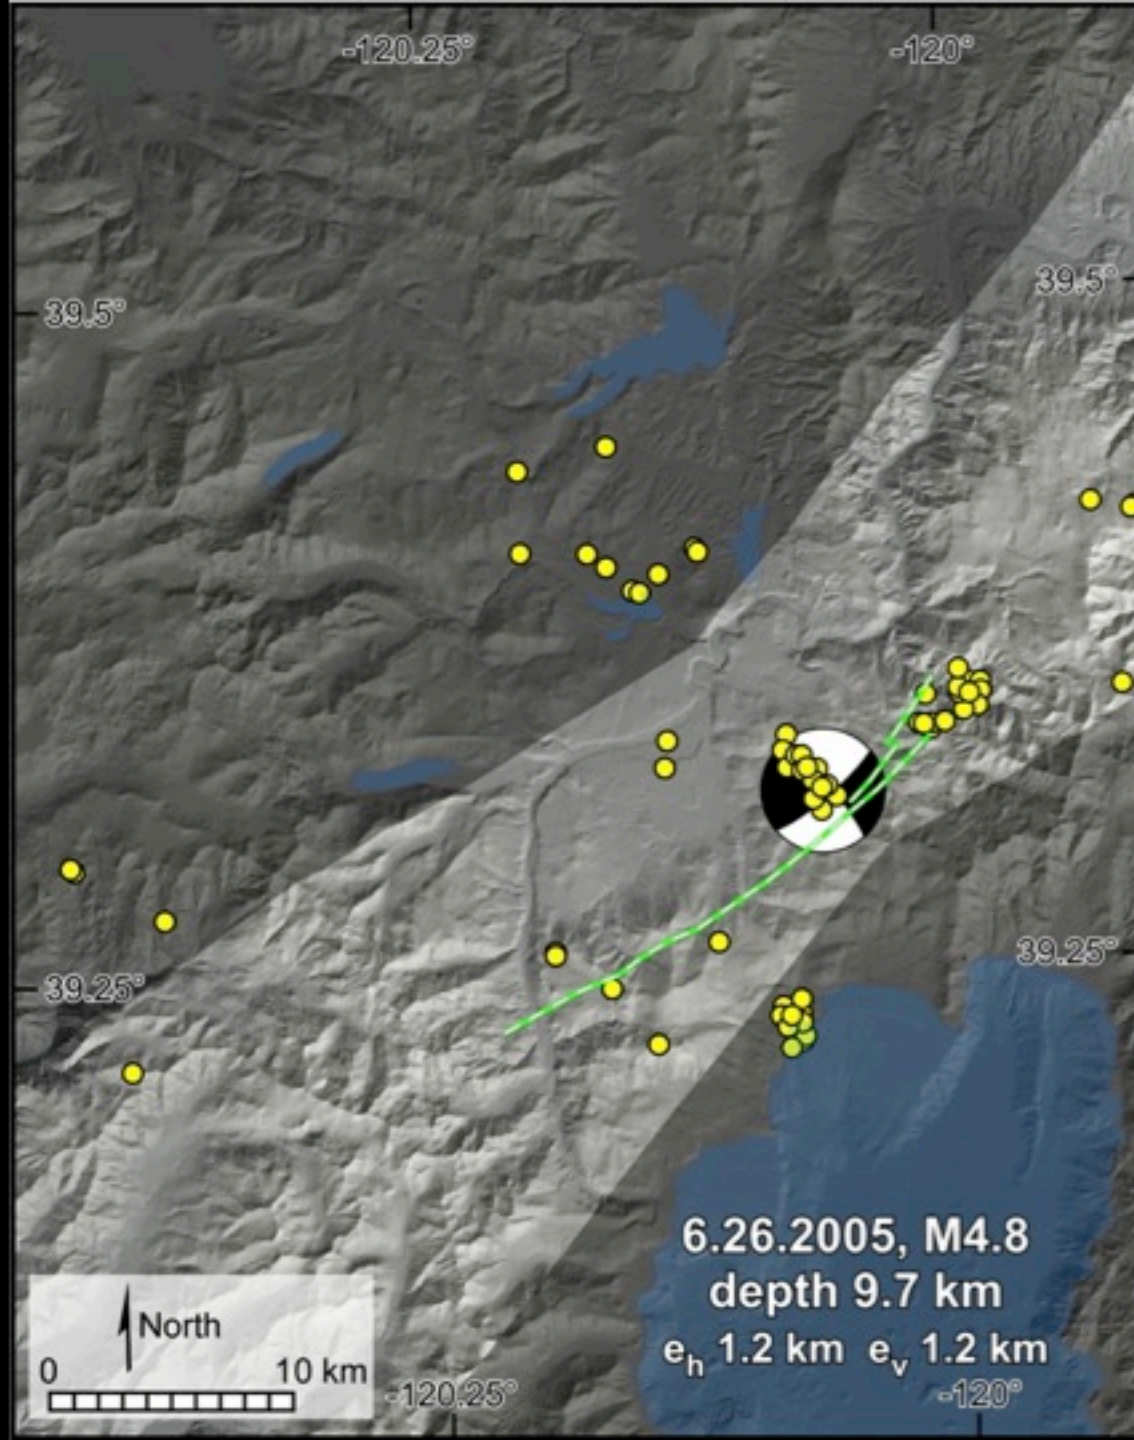

10.30.1998, M4.8
depth 10.7 km
 e_h 2.2 km, e_v 2.2 km

SLAM results suggest that the Martis Creek Trend might be a left-oblique fault that has generated historic earthquakes.

SLAM results suggest that the Martis Creek Trend might be a left-oblique fault that has generated historic earthquakes.

The Martis Creek Trend extends through the NorthStar development and is near the towns of Truckee, Tahoe City, and Incline Village.

Limitations of the Seismo- Lineament Analysis Method (SLAM)

Limitations of the Seismo-Lineament Analysis Method (SLAM)

- SLAM is only useful for shallow-focus earthquakes (<~30 km depth).

Limitations of the Seismo-Lineament Analysis Method (SLAM)

- SLAM is only useful for shallow-focus earthquakes (<~30 km depth).
- SLAM is unlikely to be helpful for very gently inclined faults.

Limitations of the Seismo-Lineament Analysis Method (SLAM)

- SLAM is only useful for shallow-focus earthquakes (<~30 km depth).
- SLAM is unlikely to be helpful for very gently inclined faults.
- The quality of the seismic data used as input to SLAM is very important.
